

# An Automated Parameter Grouping Strategy for Efficient Sensitivity Analysis of Large-scale Hydrological Models

**Razi Sheikholeslami, Saman Razavi**  
School of Environment and Sustainability  
University of Saskatchewan

# Challenges..

Modern Large-scale Hydrological Models:

Highly nonlinear

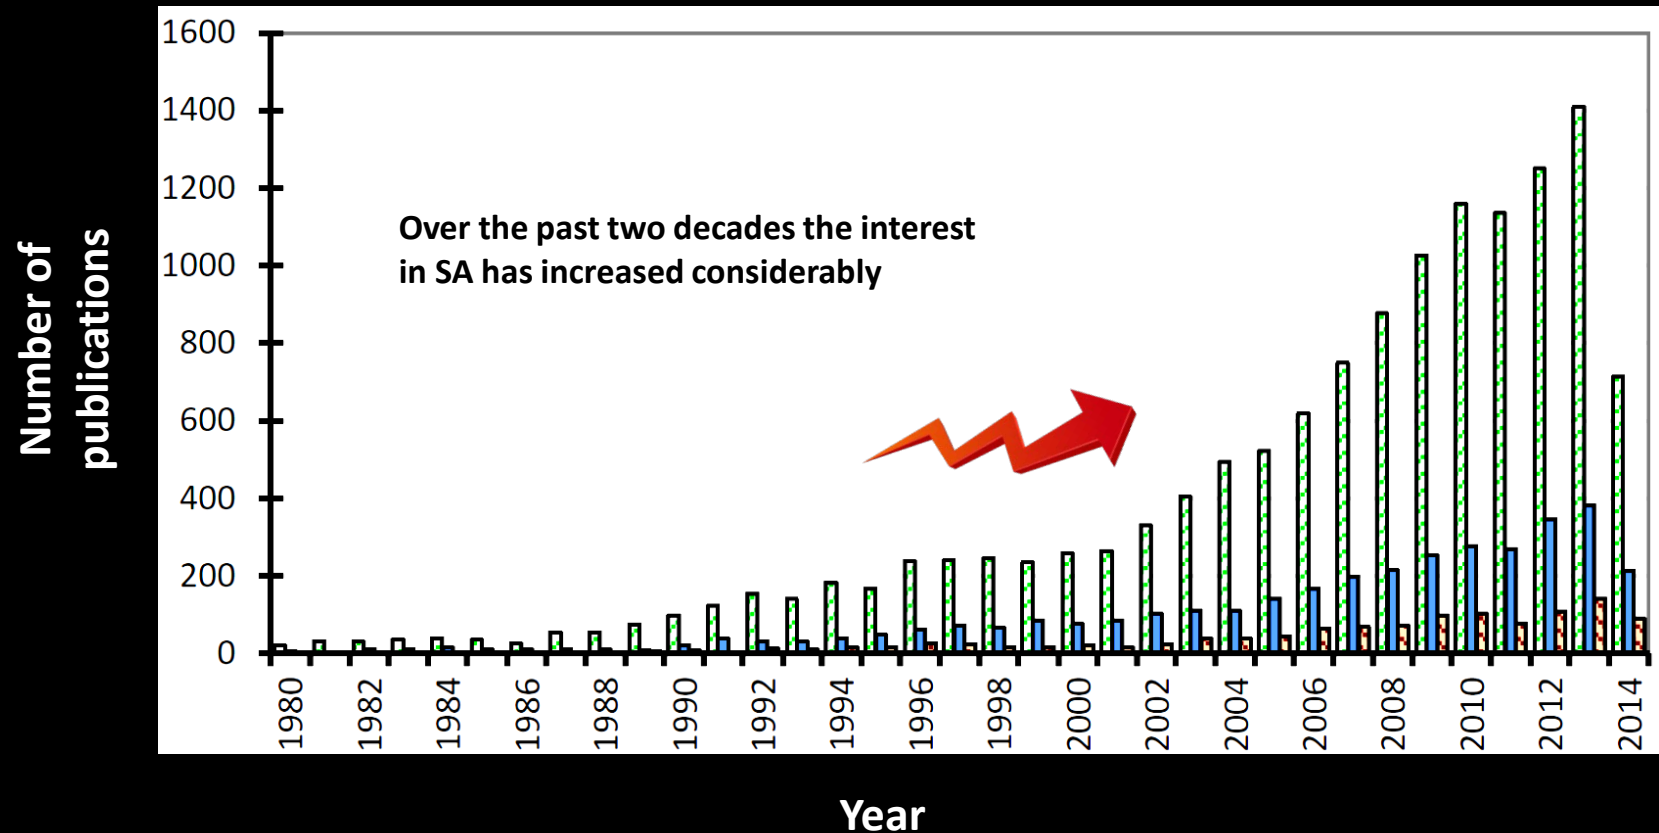

High-dimensional

Computationally intensive

# Challenges..

# Challenges..

Recent reported studies that employed GSA in the Environmental Modelling context

# Challenges..

1% of tree species in the Amazon  
account for 50% of all biomass;

20% of parameters exert significant control  
over variations in the complex models outputs

# Tackling difficulties in Sensitivity Analysis: A Grouping Solution

In high-dimensional models..

- Regardless of the SA method used, only a small subgroup of parameters are important (sparsity-of-factors).
- We are typically not interested in an exact ranking of parameters. Instead, it may be more profitable to categorize parameters into few groups; flagged as “highly influential”, “influential”, “moderately influential”, “slightly influential”, and “non-influential”.
- Interpretation of SA results is non-trivial when a problem has many parameters.
- In general, the grouping of parameters was done in a subjective and case-specific manner (prior knowledge of group membership).

# Parameter Grouping Results

# Monitoring Convergence and Robustness

# Concluding Remarks:

- **An automated factor grouping strategy is proposed to cluster input factors of high-dimensional models according to their sensitivity.**
- **A new measure of robustness is introduced based on factor grouping to evaluate and monitor convergence of the GSA techniques.**
- **The grouping-enabled GSA approach successfully recognized the dominant groups of factors that significantly contribute to the variability of the model outputs.**
- **The grouping-enabled GSA approach converged within a limited number of function evaluations.**
