This project explores the human dimensions of agricultural water management, how it is managed and governed, and the conflicts that arise. The goal of this project is to identify opportunities to foster better collaboration, such that producers can pursue sustainable and secure livelihoods while also attending to environmental concerns.

To be successful, this project engages earnestly with stakeholders in all aspects of the topic, including producers, landowners, watershed associations and stewardship groups, provincial authorities, and numerous interested NGOs.

**OBJECTIVES**

Develop new knowledge on how people govern agricultural water management by:

- Investigating the different human dimensions of agricultural water management in the prairies.
- Exploring how conflict and collaboration influence people’s ability to govern resources differently.
