

# Indigenous Engagement – in the Saskatchewan Delta

# Big Picture – What's happening in the Deltas

- Change in seasonality of flows
- Less water since early 1900s
- Sediment deposition has been disrupted
- Less lateral connectivity between river and wetlands
- Declines in biological productivity
- Loss of traditional livelihood, language and IDENTITY

Existing operations are not meeting the e-flows needs of the Saskatchewan River and Delta

Hydropeaking is a concern here because of the proximity of EB Campbell Dam

# Delta Stewardship Planning

What are we to do with this evidence? We need a plan

Global Water Futures

Distributed Water Science

A screenshot of the Distributed Water Science (DWS) login page. It features a blue header bar with the word 'Login' on the left and a small user icon with the text 'You are logged in as user' on the right. Below the header are two input fields for 'Username' and 'Password', followed by a 'LOGIN' button. At the bottom, there is a link that says 'CLICK HERE TO SIGNUP'.

We need more than water

# Challenge

Modeling approaches could account for the following:

**Dam induced flow manipulations**  
**Impacts of upstream development on fish and animals**

**Sediment regime restoration and costs –**  
**include local economic benefit**

**Verification of model parameters and dynamics**  
**with community members and local and**  
**traditional knowledge holders**

*“Does this flow make the river and delta healthy?”*

*“Is this the right flow for producing animals?”*

## Research Objectives:

**Obj. 1** To determine preferences for flow conditions (e.g., timing, color, smell, the extent of flooding, fluctuations, and seasonality) among people from Cumberland House

**Obj. 2** To determine the impact flow conditions have on fish, animals and people in the delta, according to the people who live there

**Obj. 3** To convey to hydrological modelers, knowledge about the needs of the people in Cumberland House, so they can ensure their models are responsive to the community's needs, and better inform collaborative modeling as a practice

## Sharing Photos with Narratives

# Images teach

## Pictures can tell a story

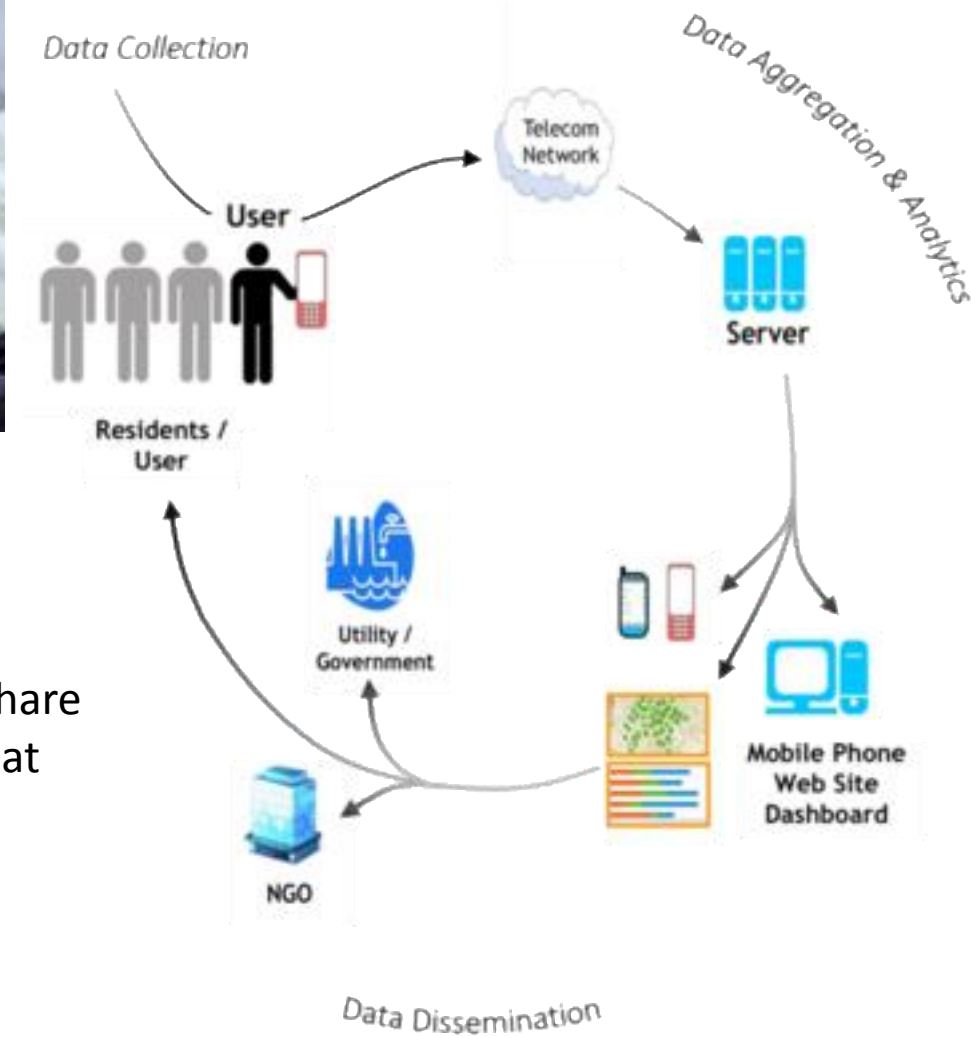

## Emphasizes individual and community action

# Modeling Collaboration

# Example of Photo Capture

# Sask River Delta

# We need more than water

- Sample and Test sediment at each reservoir
- Build sediment transport models
- Work with community to design and cost-out restoration options

# Sediment sampling

# How IMPC can support the Delta?

- Provide a variety of incoming flow conditions that reflect:
  - Changes in water resources demands and operations
  - Climate change scenarios
  - Seasonal changes in flows
  - A willingness to take consider what the delta needs in your model

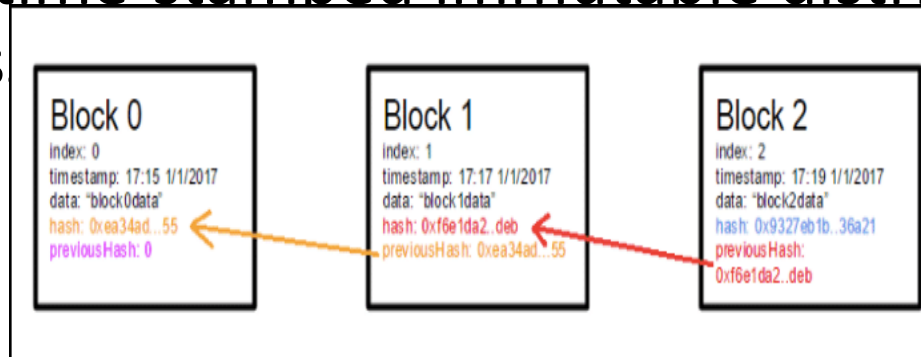

Supplemental Slides below

# Blockchain ?

In simple terms,

- **BLOCK:** collection of data
  - Blocks are connected with other blocks chronologically creating linked chain

A time-stamped immutable distributed ledger for digital as

# Why Blockchain?

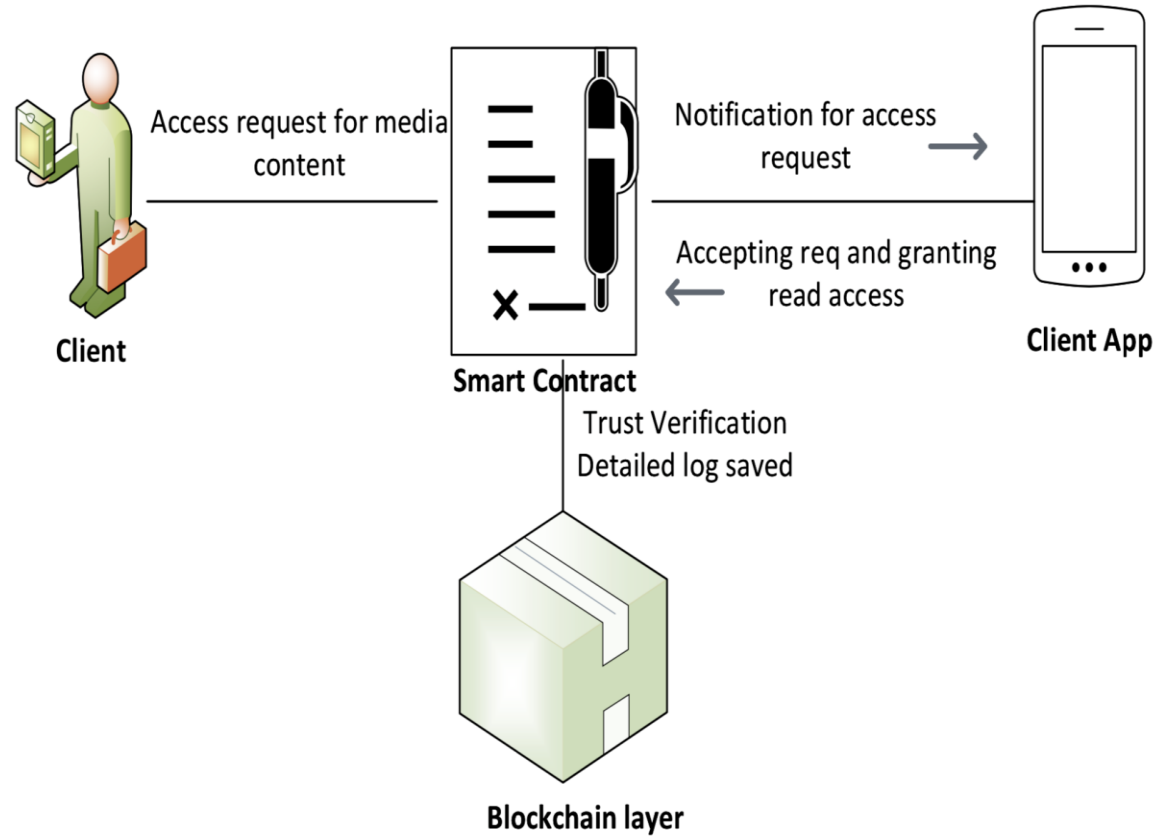

- To give the participants the right to protect their content without storing the content with one centralized location or trusted third party
- Sharing the cost of infrastructure
- Shared Trust
- No single point of failure
- No central Database
- Cannot track user across relying parties

# Key Benefits

- Decentralized network
- Secure and trustable sharing
- Tamper-proof
- Fairness and Transparency
- Having universal unique identity
- Consent
- Obscurity

# Role in DWS

# New in DWS for blockchain

- Trust Factor generation- AI and ML integration
- Consensus algorithm

## Sediment processing

- **Sieving (<2mm):** only the relevant particles
- **Freeze-drying:** remove water without altering chemicals in samples
- **Extraction:** separate chemicals from sediment particles for analysis

# Chemical analysis

- Analyze samples for a number of known priority contaminants (dioxin-like chemicals, metals, pesticides, etc.)
- Broadly screen for unknown contaminants

# The chemicals we have used are very diverse...

- Complex mixture
- **Chemical Analysis** of priority substances can only reveal a small portion of chemicals
- **Biotests** are suitable to evaluate complex environmental mixtures

>65 Mio known  
chemicals

Over 1000 of chemicals  
with elevated  
concentrations

Limited number of

- priority  
contaminants

**Is there a problem?**

## Sediment biotests

- Are used to study the effects of contaminants on organisms
- Test can make use of sediment-dwelling organisms (e.g. blackworms, midge larvae) to study effects on their survival, growth and reproduction

## Sediment biotests

- Other test use isolated cells to screen for specific groups of chemical, e.g. dioxins, hormone-like chemicals, etc.
